General Instructions.

General Information

In 0.1 mol dm\(^{-3}\) HCl, indicators are in the acidic form (HIn) only.

In 0.1 mol dm\(^{-3}\) NaOH, indicators are in the basic form (In\(^-\)) only.

There will be no mark for the answer in the dotted line box.

NOTE:

Students are suggested to check the spectrophotometer before use by measuring the absorbance values of the instrument check solution at two different wavelengths, i.e., 430 and 620 nm.

Spectrophotometer No. ________ is used throughout the experiment.

Record the absorbance values of the instrument check solution

### Part b

**Absorbance measurement of an acid-base indicator (bromothymol blue) in buffer solution**

Bromothymol blue is an acid-base indicator which shows yellow color when it is present as an acidic form (HIn) and it shows blue color when it is present as a basic form (In$^-$). The absorption maximum of the bromothymol blue in the acidic form is at 430 nm and that in the basic form is at 620 nm. The molar absorptivities of bromothymol blue in the acidic form are 16,600 dm$^3$ mol$^{-1}$ cm$^{-1}$ at 430 nm and 0 dm$^3$ mol$^{-1}$ cm$^{-1}$ at 620 nm. The molar absorptivities of bromothymol blue in the basic form are 3,460 dm$^3$ mol$^{-1}$ cm$^{-1}$ at 430 nm and 38,000 dm$^3$ mol$^{-1}$ cm$^{-1}$ at 620 nm.

1. Pipette 1.00 cm$^3$ of 1.00 × 10$^{-3}$ mol dm$^{-3}$ **bromothymol blue indicator** solution into a 25.00-cm$^3$ volumetric flask, and make up to the volume using solution A. (Note: solution A is a buffer solution pH = 7.00)

2. Record the absorbance at 430 and 620 nm.

3. Calculate the concentrations of the acidic form and basic form of **bromothymol blue indicator** solution in the volumetric flask.

4. Calculate the acid dissociation constant of **bromothymol blue**.

**b1) Record the absorbance values of bromothymol blue in buffer solution**

Part c

**Determination of solution pH by using acid-base indicator (methyl red)**

Methyl red is an acid-base indicator which shows reddish-pink color when it is present as an acidic form (HIn) and it shows yellow color when it is present as a basic form (In\(^-\)). The molar absorptivities of methyl red in the acidic form are 9,810 dm\(^3\) mol\(^{-1}\) cm\(^{-1}\) at 470 nm and 21,500 dm\(^3\) mol\(^{-1}\) cm\(^{-1}\) at 520 nm. The molar absorptivities of methyl red in the basic form are 12,500 dm\(^3\) mol\(^{-1}\) cm\(^{-1}\) at 470 nm and 1,330 dm\(^3\) mol\(^{-1}\) cm\(^{-1}\) at 520 nm. The pKa of methyl red is 4.95.

Note: There is no need to accurately measure the volumes used in this part, as it does not affect the accuracy of the results obtained.

1. Fill a test tube to one quarter with solution of unknown pH X. Add three drops of **methyl red** into the solution and mix thoroughly. Record the color.

2. Fill a test tube to one quarter with solution of unknown pH Y. Add three drops of **methyl red** into the solution and mix thoroughly. Record the color.

3. Fill a test tube to one quarter with solution of unknown pH Z. Add three drops of **methyl red** into the solution and mix thoroughly. Record the color.

**Record the color change of indicator in sample solutions (no mark)**

c1) Select one solution from the three sample solutions, of which the pH can be determined spectrophotometrically by using methyl red as an indicator.

☐ Sample X  ☐ Sample Y  ☐ Sample Z

4. Use a measuring cylinder to transfer 10 cm\(^3\) of the selected unknown solution into a beaker. Add three drops of **methyl red** indicator into the solution and mix thoroughly. Record the absorbance at 470 and 520 nm.

5. Calculate the concentration ratio of basic form and acidic form of **methyl red** in the solution.

6. Calculate the pH of the selected unknown solution.
